

HeatRotationGenerator.exe — Quick Start Guide (PDF Version)

What This Program Does

HeatRotationGenerator.exe creates balanced slot-car race rotation files. Each file contains a complete set of heats where:

- Every driver races **once in each lane**
- No driver appears **twice in the same heat**
- No driver races **more than three heats in a row**
- The number of heats per rotation equals the **number of drivers**
- Files are saved using the format:
Drivers_Lanes.txt

The program can generate **one file** or **many files at once**.

How to Use the Program

1. Open HeatRotationGenerator.exe

Double-click the program.

A window titled “**Heat Rotation Generator version 1.4**” will appear.

2. Enter the Driver Range

You may generate files for a single driver count or a full range.

- **Minimum Drivers** — the smallest driver count
- **Maximum Drivers** — the largest driver count

Example:

Min = 10, Max = 15 → generates files for 10–15 drivers.

3. Enter the Number of Lanes

Enter the number of lanes on your track (e.g., 6).

All generated files will use this lane count.

4. Enter the Number of Rotations

Usually **1**.

If you enter 2, the program generates two full rotations back-to-back.

5. Choose an Output Folder

Click **Browse...** and select where the files should be saved.

6. Generate the Files

Click **Generate Rotation Files**.

For each driver count:

- A rotation schedule is created
- The validator checks:
 - One appearance per lane
 - No duplicate drivers in a heat
 - Correct number of heats
 - Maximum three consecutive heats
- If validation fails, you may choose:
- **Yes** — save the file anyway
- **No** — skip saving that file

7. Find Your Files

Files are saved in your chosen folder using names like:

12Drivers_6Lanes.txt 13Drivers_6Lanes.txt 14Drivers_6Lanes.txt

Each file contains a JSON-style structure listing all heats.

You're Ready to Race

Your rotation files are now ready for:

- Race Coordinator
- Club race nights
- Testing formats
- Sharing with other organizers
